

AERO-100 Inspection Manual

AERO-100 Synthetic Aviation Documentation

1.1 Inspection Principles

Aircraft inspections are performed to identify conditions that may require maintenance action or further assessment.

Inspection activities should follow the applicable inspection procedure and use the required inspection equipment.

2.1 Visual Inspection

Visual inspection may include examination for visible damage, leakage, corrosion, loose components, deterioration, or other abnormal conditions.

Inspection personnel should document relevant findings according to the applicable recording process.

3.1 Hydraulic System Inspection

The AERO-100 hydraulic system inspection should include examination of accessible hydraulic lines, fittings, connections, and associated components.

Inspectors should check for visible hydraulic fluid leakage, damaged hydraulic lines, loose fittings, and signs of component deterioration.

Where applicable, hydraulic pressure indications should be reviewed for abnormal conditions.

Any significant abnormal finding should be documented and referred for appropriate maintenance assessment.

3.2 Engine Inspection

Engine inspection should include examination of accessible engine areas for visible damage, leakage, deterioration, and other abnormal conditions.

Findings should be recorded and assessed using the applicable inspection process.

4.1 Structural Inspection

Structural inspection activities may include examination for visible cracks, deformation, corrosion, damage, or other conditions requiring further assessment.

Inspection personnel should document relevant findings and escalate significant abnormalities according to applicable procedures.
