

AERO-100 Safety Procedures

AERO-100 Synthetic Aviation Documentation

1.1 Safety Management

Safety management activities are intended to identify hazards, assess risks, and support appropriate mitigation actions.

Personnel should report relevant hazards and safety concerns through established organizational reporting channels.

2.1 Hazard Identification

Hazards may be identified through inspections, operational reports, maintenance findings, incident reports, or other safety information.

Identified hazards should be documented sufficiently to support subsequent assessment.

2.2 Risk Assessment

Risk assessment should consider the potential severity and likelihood associated with an identified hazard.

Risk assessments should be reviewed when new information becomes available or when operating conditions change.

3.1 Maintenance Safety

Maintenance personnel should follow applicable safety procedures before working on aircraft systems.

Appropriate personal protective equipment should be used when required by the applicable task or organizational procedure.

Energy sources and aircraft systems should be controlled or isolated when required to reduce maintenance hazards.

4.1 Safety Reporting

Personnel should report safety concerns, hazards, and relevant events through approved reporting channels.

Safety reports should contain sufficient information to allow the organization to understand and investigate the reported concern.
